- Account **sublocations** within warehouse location.

- With features for **stock out management.**

- With features for **standard inventory replenishment.**

- Can be integrated with **Barcode System**

- With features for **stock adjustment and history.**

Optional Features

Customer Access Options
- Provide Stock Visibility to Customers

Demand/ Forecasting Options
- Automatic calculations of demand requirements

Basic Features

Warehouse

Inbound Management   **Stock Management**   **Outbound Management**

INBOUND PLAN	INSPECTION	RECEIVING RESULT	STORAGE/STOCK	OUTBOUND PLAN	PICKING	OUTBOUND RESULT
Plan is created when the cargo is inbound. The data entry can use barcodes to scan the items to be entered. A receiving plan report can be generated on this module.	Inspection is done on the cargo to classify if it's in good condition.	From plan the cargo now is inbounded to the warehouse. A cargo received report is generated. The storage location will be advised based on the last location of the item outbounded(for same items).	The cargo now is placed on the storage location. An inventory/stock can be monitored on the system.	Delivery plan is created when outbounding the cargo. A delivery plan report can be generated on this modules.	The picking list is generated to select which cargo to outbound from the warehouse. FIFO is the process. The Lot No/Outbound date is the criteria.	From delivery plan the the actual cargo will be now outbounded for delivery.
